Project Write-Up

The simulation I created for my project is a random number generator that creates a random number that is 1 through 100. There is also a counter that counts how many times you click the button that generates a number. There is also a reset button that reset the number that was generated to zero and also resets the click count. To use the user interface you first click on the number button to generate a number, this will give you a number 1 through 100. After the number of clicks will go up by 1. You click the reset button if you are done playing and this will also reset the number of clicks.
